

If you find yourself unexpectedly pregnant and would like to discuss your options in a non-judgemental and discrete environment, don't hesitate to call and make an appointment with FMP Woonona.

By providing medical termination of pregnancy (MTO), GPs can now provide effective help to women when they are faced with an unplanned pregnancy. Should a termination of pregnancy (abortion) be the right choice for you at the time, then we can help you through the process.

Dr Sanjeet Hyare is trained to prescribe MS2step, the medication used for medical termination of pregnancy (this medication brings on a process similar to a miscarriage). You do have to be less than 9 weeks pregnant for this to be possible. We are also able to discuss with you options for surgical termination of pregnancy if you fall outside of this criteria.

You will need an initial appointment where we will organise some tests and discuss what to expect, a second appointment where we review the results and prescribe the medication, and a third appointment where we check everything has gone to plan.

If you normally attend another medical practice and your doctor is sending you to see us, we do need the following tests to be done before we are able to prescribe the medication:

Ultrasound of pelvis

Blood tests (FBC, HCG, blood group and antibodies), and a urine test for chlamydia.

If your usual GP has referred you to us without all these tests being done, we are happy to refer you for them, but attending your initial appointment with them done already does make the process quicker for you.

In the rare event of complications, patients can present to the nearest hospital emergency department as they would if seeking treatment for spontaneous miscarriage and its complications.

If you are considering a medical termination of pregnancy, please call our reception staff and say that you want an MS2step appointment so we can make the appropriate arrangements.
